In today’s changing world, unplanned events and travel restrictions make it nearly impossible to continue “business as usual.” To ensure your business can continue normal operations, you need to enable your employees to work remotely and maintain productivity, increase connectivity, and provide for continuous, and most importantly secure access to applications across endpoints. We’re here to help you protect all endpoints that are accessing organizational assets remotely.

Cloud-native Endpoint Protection
VMware Carbon Black Cloud makes it easy to reduce the attack surface, prevent malicious behavior, and respond to attacks no matter where the endpoints are located.

No Corporate Network Connection Needed
Remote work sometimes means unreliable network connections for your users. Even if the network is unstable, your users will be protected. Traditional endpoint protection does not update if it’s not connected to the corporate network. With the Carbon Black Cloud, you can ensure ALL devices have the most up to date protection anywhere in the world, anytime.

Greater Visibility
Traditionally, security teams have no visibility to devices out of the office. However, the Carbon Black Cloud provides you with always on EDR, even when the device is out of the office. Now, you’ll know what’s happening on every endpoint—regardless of where in the world it is.

Securing Work from All Devices
Your workforce needs to be able to work from whatever device, and that might even mean using less secure personal devices to access key corporate assets. The Carbon Black Cloud can be quickly deployed to users’ personal devices to provide corporate level protection and visibility delivered from the cloud.

Real-Time Device Assessment and Remediation
IT Ops teams need to be able to patch and configure devices remotely. With the Carbon Black Cloud, teams can identify vulnerabilities, install patches and validate configuration remotely via the cloud; giving you the confidence that every endpoint is up to date on the latest policies and secure.

Accessible Anywhere
In turbulent times, your Security Operations teams may also be working remotely, and traditional on-premise security tools are difficult to access and operate. The Carbon Black Cloud is cloud delivered and can be accessed easily by security teams working remotely. Making everyone’s jobs a little bit easier when you really need it.

The VMware Carbon Black Cloud delivers the entire protection cycle of harden, prevent, detect, and respond for endpoints and workloads spread across the globe.

• Security operations has direct access to all endpoints to remediate any vulnerability or risky system configuration, in real-time.
• Layered prevention stops known and unknown malware and never-before-seen attacks with machine learning and behavioral analytics.
• Cloud native platform and single, lightweight agent makes it easy to secure your endpoints even when both your workforce and your security teams are operating remotely.
